

# CONTENTS

1. THE BORN–OPPENHEIMER HAMILTONIAN	1
1. Separating the center of mass motion in quantum mechanics . . . . .	1
1.1. Reducing the two-body problem to two one-body ones . . . . .	1
1.2. The center of mass in quantum mechanics . . . . .	6
1.3. Free atoms and atomcules . . . . .	9
2. The Born–Oppenheimer approximation . . . . .	12
2.1. Introductory remarks . . . . .	12
2.2. The Born–Oppenheimer separation . . . . .	13
2.3. Why the Born–Oppenheimer separation is not exact . . . . .	14
2.4. Approximate decoupling . . . . .	15
2.5. A note on the Born–Oppenheimer separation . . . . .	16
Notes . . . . .	17
2. GENERAL THEOREMS AND PRINCIPLES	19
1. The variation principle . . . . .	19
1.1. The Rayleigh quotient . . . . .	19
1.2. The variation principle for the ground state . . . . .	19
1.3. The variation principle as an equivalent of the Schrödinger equation: A useful formulation of the variation principle	21
1.4. Eckart’s inequality . . . . .	23
1.5. Excited states . . . . .	24
2. The Hellmann–Feynman theorem . . . . .	26
2.1. The differential Hellmann–Feynman theorem . . . . .	26
2.2. The integral Hellmann–Feynman theorem . . . . .	31
3. The virial theorem in quantum mechanics . . . . .	32
3.1. Time dependence of a physical quantity . . . . .	32
3.2. The virial theorem . . . . .	33
3.3. Scaling—a connection with the variation principle . . . . .	35
3.4. The virial theorem in the Born–Oppenheimer approximation . . . . .	36
3.5. The virial theorem and chemical bonding . . . . .	41
Notes . . . . .	42

3.	THE LINEAR VARIATIONAL METHOD AND LÖWDIN'S ORTHOGONALIZATION SCHEMES	45
1.	The linear variational method (Ritz method)	45
2.	Löwdin's symmetric orthogonalization	52
2.1.	Matrix $\mathbf{S}^{-1/2}$	52
2.2.	The $\mathbf{S}^{-1/2}$ transformation	53
2.3.	The Löwdin basis	54
2.4.	The stationary property of Löwdin's symmetric orthogonalization scheme	55
2.5.	Löwdin orthogonalization: A two-dimensional example	59
3.	Linear independence of the basis and Löwdin's canonic orthogonalization	62
3.1.	Eigenvalues of the overlap matrix: A measure for the linear independence of the basis	62
3.2.	Löwdin's canonic orthogonalization	64
	Notes	67
4.	PERTURBATIONAL METHODS	69
1.	Nondegenerate Rayleigh–Schrödinger perturbation theory	69
1.1.	The problem	69
1.2.	“Algebraic” expansion	72
1.3.	The use of the reduced resolvent in the Rayleigh–Schrödinger perturbation theory	76
1.4.	Wigner's $2n + 1$ theorem	81
1.4.1	The accuracy of the energy expectation value calculated by the $n$ th order perturbational wave function	81
1.4.2	Computing the exact energy corrections up to order $2n + 1$ by using the first $n$ wave function corrections	82
2.	Variational–perturbational method: The Hylleraas functional	88
3.	Degenerate Rayleigh–Schrödinger perturbation theory	93
4.	Brillouin–Wigner perturbation theory	95
4.1.	The size–consistency problem	98
5.	Size consistency of the Rayleigh–Schrödinger perturbation theory	100
5.1.	Formal considerations based on the properties of power series	100
5.2.	Size consistency of the perturbational expansions	102
6.	Löwdin's partitioning method	115
	Notes	118
5.	DETERMINANT WAVE FUNCTIONS	121
1.	Spin orbitals	121
2.	Many-electron spin states	124
3.	Slater determinants	126

3.1.	Two-electron examples . . . . .	127
4.	The antisymmetrizing operator . . . . .	129
4.1.	The projection character of the antisymmetrizing operator . . . . .	130
4.2.	Commutation properties of the antisymmetrizing operator . . . . .	134
4.3.	Antisymmetrization between distant subsystems . . .	135
5.	Invariance of the determinant wave function with respect to “mixing” the occupied orbitals . . . . .	137
6.	Matrix elements between determinant wave functions: Löwdin’s general formulae for nonorthogonal orbitals . . . . .	140
6.1.	Overlap . . . . .	140
6.1.1.	General case . . . . .	141
6.1.2.	Factorization . . . . .	142
6.1.3.	Special cases for orthonormalized orbitals (Slater rules)	144
6.2.	One-electron operators . . . . .	145
6.2.1.	General case . . . . .	145
6.2.2.	Special cases for orthonormalized orbitals (Slater rules)	147
6.3.	Two-electron operators . . . . .	149
6.3.1.	General case . . . . .	149
6.3.2.	Special cases for orthonormalized orbitals (Slater rules)	151
7.	Löwdin’s pairing theorem and its generalization . . . . .	153
7.1.	Löwdin’s pairing theorem . . . . .	154
7.2.	Karadakov’s extended pairing theorem . . . . .	157
8.	Theorem about the existence of orbitals of special structure .	160
8.1.	Existence theorem . . . . .	161
8.2.	<i>A posteriori</i> determination . . . . .	162
	Notes . . . . .	163
6.	THE HARTREE–FOCK METHOD . . . . .	165
1.	The variation principle for single determinant wave functions: The Brillouin theorem . . . . .	166
1.1.	The Brillouin theorem for the determinant with the absolute minimum of the energy . . . . .	166
1.2.	The Brillouin theorem for a determinant with a stationary energy . . . . .	167
1.3.	Algorithm of calculations based on the Brillouin theorem . . . . .	169
2.	The Hartree–Fock equations . . . . .	170
2.1.	Unrestricted Hartree–Fock equations . . . . .	171
2.2.	Alternate derivation by using Lagrangian multipliers .	177
2.3.	Alternate derivation by using specified variations . . .	180
3.	Koopmans theorem . . . . .	182
3.1.	The orbital energies and the total energy . . . . .	184

4.	The RHF method . . . . .	187
4.1.	The RHF and UHF schemes . . . . .	187
4.2.	Symmetry and the RHF method . . . . .	189
4.3.	The “dissociation catastrophe”; different Hartree–Fock methods . . . . .	190
4.4.	Singlet and triplet excitations . . . . .	195
5.	Finite basis Hartree–Fock theory . . . . .	198
5.1.	Hartree–Fock–Roothaan equations . . . . .	198
5.2.	The P-matrix . . . . .	202
5.3.	Example of using projectors in the LCAO framework: The UHF equations for successive optimization of the orbitals . . . . .	204
5.4.	The Fock matrix and the energy . . . . .	206
6.	Restricted open-shell Hartree–Fock method . . . . .	209
6.1.	The ROHF equations . . . . .	211
6.2.	The coupling coefficients for some open-shell systems . . . . .	215
7.	The gradient of the energy . . . . .	216
	Notes . . . . .	223
7.	POPULATION ANALYSIS, BOND ORDERS, AND VALENCES . . . . .	227
1.	Mulliken’s population analysis . . . . .	228
1.1.	Electron density . . . . .	228
1.2.	Population analysis . . . . .	230
2.	Bond orders and valences . . . . .	235
2.1.	Bond order index . . . . .	235
2.2.	Valence indices . . . . .	238
2.3.	Exchange density and bond order . . . . .	241
2.4.	Bond orders in three-center bonds . . . . .	245
	Notes . . . . .	247
8.	THE ELECTRON CORRELATION . . . . .	251
1.	The CI expansion . . . . .	251
2.	The correlation energy and Nesbet’s theorem . . . . .	253
3.	Methods of electron correlation calculations . . . . .	260
3.1.	The CI method . . . . .	260
3.2.	MC–SCF methods . . . . .	262
3.3.	The MBPT or Møller–Plesset method . . . . .	264
3.4.	The Coupled Cluster Approach . . . . .	269
	Notes . . . . .	278
9.	MISCELLANEOUS . . . . .	281
1.	The $1/Z$ expansion . . . . .	281
2.	The cusp condition . . . . .	283
2.1.	The nuclear cusp . . . . .	283
2.2.	The electronic cusp . . . . .	286

3.	The asymptotical behavior of the wave function at very large distances . . . . .	286
4.	Basis functions: The Gaussian product theorem . . . . .	287
5.	The integral transformation problem . . . . .	290
	Notes . . . . .	291
Appendices		294
I.	Separating the motion of the center of mass in classical mechanics	295
II.	Reducing the two-body problem to two one-body ones in classical mechanics . . . . .	299
III.	Analogy between differentials and variations . . . . .	303
IV.	Euler's theorem for homogenous functions . . . . .	305
V.	The virial theorem in classical mechanics . . . . .	307
VI.	The electronic Schrödinger equation in atomic units . . . . .	309
VII.	The "bra-ket" formalism . . . . .	311
	1. Dirac's "bra" and "ket" vectors . . . . .	311
	2. Analogy with the matrix formalism . . . . .	313
	3. The use of an overlapping basis . . . . .	314
	4. Example of using the bra-ket formalism: The hypervirial theorem . . . . .	315
	5. Projection operators . . . . .	316
	6. Resolution of identity . . . . .	317
	7. Spectral resolution of Hermitian operators . . . . .	318
	8. The case of non-Hermitian operators—biorthogonal sets of functions . . . . .	319
	9. The trace of the projector . . . . .	321
VIII.	Collection of formulas for Rayleigh–Schrödinger perturbation theory (nondegenerate case) . . . . .	323
IX.	Direct products of matrices . . . . .	325
X.	Permutations . . . . .	329
XI.	An orthogonalization algorithm . . . . .	331
